                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC Primers AAV60731-V60732 were used to PCR amplify codons 1-149 of the CC human cyclin-dependent kinase 2 (hCDK2) gene. The amplified product was CC used to generate a fusion protein comprising part of the hCDK2 sequence CC linked to codons 154-302 of the yeast PH085 gene. The fusion protein is CC proteins. The method comprises administering a compound to a cell line, CC which contains a reporter gene linked to an Upstream Activation Sequence CC (UAS) and a promoter, where the UAS binds a transcription control factor CC (TCF) which is regulated through cyclin/cyclin-dependent kinase (CDK) phosphorylation. Also included in the construct is an effector gene CC providing a gene product to permit normal cyclin/CDK regulation of the reporter gene is then analysed in the cell line, CC Expression of the reporter gene is then analysed in the cell line, CC TF. Expression of the reporter gene is then analysed in the cell line, CC the method can be used to identify inhibitors and activators of mammalian CC cell cycle regulatory proteins, especially inhibitors and activators of cyclins, CDKs, cyclin/CDK complexes, cyclin kinase inhibitors (CKIs), and CC cyclins, CDKs, cyclin/CDK complexes, cyclin kinase inhibitors (CKIs), and CC excessive cell growth and division (as in cancer therapy)
                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fos protein. The present invention also describes antisense oligonucleotides which regulate the c-Jun protein. The antisense oligonucleotides are used for the diagnosis and treatment of diseases or disorders associated with Activating Protein 1 expression, of which c-Fos and c-Jun are subunits. The antisense oligonucleotides are used in compositions as c-Fos and/or c-Jun together with a carrier and a chemotherapeutic agent. They are used to regulate the expression of c-Fos or c-Jun in cells or tissues, preferably by inhibiting metastasis. They also regulate cell cycle expression and can be used to treat an animal with, or being prone to, a hyperproliferative disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense oligonucleotides regulating Activating Protein hybridise with c-fos and c-jun mRNA, used for regulating cycle expression and hyperproliferative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            W09846272-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAV69949 to AAV69977 represent antisense oligonucleotides which are specifically hybridisable with a region of a nucleic acid encoding hur c-Fos protein. The antisense compound regulates the expression of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 1998-609906/51

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     primers AAV11260-V11266 are used in the isolation of the human multiple tumour suppression proteins, MTS1 and MTS1E1-beta. The MTS gene locus is also referred to as the familial melanoma (MLM) gene locus, located on human chromosome 9921. Germ line mutations in MTS genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI;

CC cell; (b) determining in the first cell and the second cell the pattern CC of expression of genes in a selected gene family; and (c) calculating a growinity index using a specified formula. The methods can be used for CC characterising cells, e.g. for determining the origin of a cell, its CC genetic status, whether it carries a genetic defect, or whether it is CC transformed. They can be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the CC effect of a selected treatment on a test cell. They can also be used for Obtaining cells capable of expressing an homeobox related desired CC property. The method uses reverse transcriptase polymerase chain reaction CC (RT-PCR) for determining the pattern of gene expression in a selected CC gene family. Sequences AAZI7803-Z18342 represent primers that can be used CC in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor cc superfamily genes or cadherin superfamily genes

Identifying and characterizing cells by comparing the expression in a selected gene family. pattern of gene

P-PSDB; AAY14700 WPI; 1999-419113/35

Claim 4; Page 46; 102pp; English

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the second cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell comprises:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZ17803-Z18342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor
                                                            This reverse primer was used with a forward primer (see AAZ20187) in the PCR amplification of a poorly conserved 407 bp fragment of bovine pregnancy associated glycoprotein (PAG) PAG1, 5, 6 and 7 cDNA (see AAZ20191, AAZ20164, AAZ20165, AAZ20166). Another primer pair (see AAZ20185-86) was used to amplify a poorly conserved 536 bp fragment of bovine PAG2, 4, 8, 9 or 11 cDNA (see AAZ20162, AAZ20179, AAZ20167, AAZ20181). The amplified fragments were used as probes in experiments to demonstrate that certain PAG3, including bovine PAG4, 5, and 9 (see AAX20163-67), are expressed in trophoblast binucleate cells and in the syncytium formed between trophectoderm and uterine epithelium such PAGs are useful in immunoassays of the invention for the early
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 protein phosphatase genes, P450 enzyme ger superfamily genes or cadherin superfamily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      20-MAR-1998;

Cells expressing the new receptor subunits are useful for identifying GABABR agonists and antagonists. HG20 proteins and their antagonists are useful for inhibiting HG20 or GABABR function, useful for treating depression, epilepsy, neuropsychiatric disorders, dementias, muscular contractions, and central nervous system disorders. The present sequence represents a PCR primer for human HG20, which is used in the exemplification of the

                                                                                                                                                                                               This sequence represents a human iPFK-2 antisense oligonucleotide. The invention relates to a cancer malignancy diagnostic assay for determining the presence of inducible phosphofructokinase-2 (iPFK-2) specific comprises obtaining a sample of a body or tumour fluid or tissue. The assay comprises obtaining a sample of a body or tumour fluid or tissue and performing a sequence identity assay to look for the presence of iPFK-2 specific sequences. The method is useful for diagnosis of malignant cancer by detecting the presence of iPFK-2 specific sequences. Antisense iPFK-2 oligonucleotides are useful for treatment of cancer and inflammatory disease. Antagonists of iPFK-2, such as an iPFK-2 enzyme inhibitor or anti-iPFK-2 antibody are also useful for treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (PICO-)

The assay comprises obtaining a sample of a body or tumour fluid or tissue and performing a sequence identity assay to look for the presence of iPFK-2 specific sequences. The method is useful for diagnosis of malignant cancer by detecting the presence of iPFK-2 specific sequences. Antisense iPFK-2 oligonucleotides are useful for treatment of cancer and inflammatory disease. Antagonists of iPFK-2, such as an iPFK-2 enzyme inhibitor or anti-iPFK-2 antibody are also useful for treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 1999-313301/26

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAV74237-V74253 are oligodeoxynucleotide (ODN) primers used to describe a method for enhancing the immunostimulatory effect of an antigen encoded by nucleic acid contained in a nucleic acid construct. The method involves determining the CpG-N and CpG-S motifs present in the construct, removing neutralising CpG (CpG-N) motifs and optionally inserting stimulatory CpG (CpG-S) motifs in the construct, thereby producing a nucleic acid construct having enhanced immunostimulatory efficacy. The method can be used for immunisation against viral antigens, e.g. from hepatitis B virus (HBV), bacterial antigens or an antigen derived from a parasite. They can also be used for expression of a therapeutic polypeptide, e.g. growth factors, toxins, tumour suppressors, cytokines, apoptotic proteins, interferons, hormones, clotting factors, ligands and receptors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 20 BP; 0 A; 6 C; 14 G; 0 T; 0 U; 0 Other;
                                                           AAV74293-V74297 are antisense oligonucleotide primers used against the intercellular adhesion molecule ICAM-1 for preventing perfusion injury during transplantation. The oligonucleotides are used for pre-operative treatment of the transplant donor or for pre-treatment of the donor organization (preferably kidney, heart, lung or pancreas) before transplantation
                                                                                                                                                                                                                                                                                                                                              Use of antisense oligonucleotide against ICAM-1 - for preventing perfusion injury during transplantation of e.g. kidney, heart, lung

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligonucleotides AAV70607-11 were used to isolate nucleic acid encoding a murine multiple tumour suppressor IEI-beta (MTSIEI-beta) protein. Primers designed from the gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys. (Updated on 20-MAR-2003 to correct PR field.)

17-DEC-1997;
04-NOV-1998;
                                                                                                                                                                                        PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAY36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion
                                                                                        Sequence 20
                                                                                                                                conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis pneumopathy in breast feeding infants; and venereal lymphogranulor. The polypeptides of the invention may be of use in treating these

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFS encode polypeptides (see AAY3673+397949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as snogonococcal uretritis, pepidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogramulomatosis. The polypeptides of the invention may be of use in treating these

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, pepidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
```

PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAY36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as

nonendemic trachoma, paratrachoma,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                    molecules for inhibitory efficiency. The method comprises: (a) determining the fraction of each of a set of 13 nearest-neighbour nucleic acid base pair types in a target sequence zone RNA:ASO-DNA hybrid nucleic acid sequence; (b) substituting nearest-neighbour nucleic acid base pair fractions into formulas to determine the fractions of each of a series of 13 nearest-neighbour nucleic acid base pair types to provide determined fractions, and (c) multiplying the fractions of the 13 nearest-neighbour nucleic acid base pair types by a stability ranking to the nucleic acid antisense sequence; where the results are ordered to produce a ranking.
                                                                                                                                                                                                                                                      targeted which is
       antisense

                                                                                                                                                PCR primers AAZ10708-33 were used to amplify exons 1 to 11 of human HKNG1 (Hong Kong new gene 1). HKNG1 is a gene associated with bipolar affective disorder (BAD). HKGN1 polynucleotides are useful to identify compounds condulating HKNG1 gene expression or HKNG1 polypeptide expression or activity. Compounds inhibiting or enhancing HKNG1 gene expression or controlled the compounds inhibiting or enhancing HKNG1 gene expression or controlled the compounds can then be administered therapeutically to treat the CHKNG1-mediated disorders, especially neuropsychiatric disorders e.g. BAD, controlled the compounds of the compounds of the polynucleotides can be used in gene controlled the compound disorders. They are also useful in controlled to identify individuals having, or at risk of developing, HKNG1 compounds to identify individuals having, or at risk of developing, HKNG1 compounds to the human full-length HKNG1 polypeptide or splice variant sequences, especially the substitution of a protein with a different consequences, especially the substitution of also useful in gene mapping, to produce probes or primers to identify similar sequences (e.g. mutants consequences from different species) and to produce transgenic animals

                                                                 Ś
                                                                                                                                                                                                                                                                                                                                                    The present invention describes an isolated nucleotide sequence (I) cencoding at least a portion of the human alpha-7 neuronal nicotinic ce encoded by (I); (2) a vector comprising (I); (3) a host cell transformed with a vector of (2); (4) a polynucleotide comprising at least 15 cm uncleotides which hybridises under stringent conditions to at least 15 cm portion of (I); (5) a method for detection of a polynucleotide encoding comprising at least 15 cm portion of (I); (5) a method for detection of a polynucleotide encoding comprision at least 15 cm coding alpha 7-hnAchR in a biological sample; and (6) a method for amplification cof nucleic acid from a sample suspected of containing nucleic acid concoding alpha 7-hnAchR. The primers and probes from the present convention can be used on brain tissue and blood samples of humans compected of suffering from schizophrenia, small cell lung carcinoma, compected of suffering from schizophrenia, small cell lung carcinoma, compected of suffering from schizophrenia, small cell lung carcinoma, compected of suffering from schizophrenia, small cell lung carcinoma, compected of suffering from schizophrenia, small cell lung carcinoma, compected of suffering from schizophrenia, small cell lung carcinoma, compected of suffering from schizophrenia, small cell lung carcinoma, compected of suffering from schizophrenia, small cell lung carcinoma, compected of suffering from schizophrenia, other illness. This is particularly useful cor diagnosis of schizophrenia. Other illness. This is particularly useful cor studied/diagnosed are epilepsy (e.g. juvenile myoclonic epilepsy) and correct of the suffering from syndromes.
                                                                                                                                                                                       Query Match

The ASO is used to inhibit expression of a gene in an animal and for treating the animal when afflicted with a disease or disorder characterised by the presence of an mRNA from a gene containing a GGGA motif. The ASO are specifically targeted to a GGGA sequence motif found in mRNA from a gene. A study of known ASO has shown that at least half of the most efficacious ASO's contain one or more TGCC motifs. This ASO comprises a TCCC motif followed by a cytosine residue and corresponds to a region of the human ICAM-1 3' untranslated region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX94584- AAX95879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584- AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae enucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising

The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX94584- AAX95879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

                                                                                                                                        Best
                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                      AAX31991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX31990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, crythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34584 - AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX94584- AAX95879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                             Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine;

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX94584- AAX95879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91900). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX914584 - AAX95879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                      AAA08849-60 are oligonucleotide primers and adaptors used in cloning the murine DKR-3 gene (AAA0883B). The murine DKR-3 open reading frame has homology to human rig-like 7-1 mRNA and to chicken lens fiber protein clfest 4 gene. DKR-1 is a human ortholog of dkk-1 (dickkopf-1), a novel gene identified in Xenopus and mouse, purportedly an antagonist of wnt-8 signaling. DKR-2, -3 and -4 are each related to DKR-1 by their cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Page 1734;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Genome sequence of Chlamydia pneumoniae
pattern. Dkk-1 is also involved in morphogenesis in the developing embryo, and therefore a growth factor, by inference DKR polypeptides are also growth factors. The DKR polypeptides are useful for treating cancer, e.g. mammary tumors, stem cell tumors, or other cancers in which the wnt
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-AUG-2000

                                                                            The invention relates to the isolation of the gene encoding the human multiple tumour suppressor 1 (MTS1) (AAA95633). The MTS1 protein has a cytostatic activity and is used in protein replacement therapy. This sequence is a PCR primer used to isolate the mouse p16 gene (a homologue of the MTS1 gene). MTS1 is useful in diagnosing human cancers such as (ocular) melanoma, leukemia, astrocytoma, glioblastoma, lymphoma, glioma, hodgkin's lymphoma, multiple myeloma, sarcoma, myosarcoma, cholangiocarcinoma, squamous cell carcinoma, CLL, and cancers of pancreas, breast, stomach, brain, prostate, bladder, thyroid, ovary, uterus, testis, kidney, colon and rectum. The MTS1 gene and protein mimetic register.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and/or sonic hedgehog (shh) signal transduction pathways are activated. They can also be used to enhance tissue differentiation, such as bone formation and hematopoietic cell formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 20 BP; 4 A; 5 C; 9 G; 2 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel protein composition useful in protein replacement therapy diagnosing and treating cancer comprises a specific weight perce human multiple tumor suppressor 1 polypeptide.

The present invention describes oligonucleotides containing bioreversible CC phosphate ester groups and their mimetics. The oligonucleotides are of CC value in therapeutics, diagnostics, and as research reagents. The CC compound from the present invention may be used in control of hereditary, CC metabolic, and/or cellular processes in any organism utilising DNA.-NNA CC transcription and/or NNA-protein translation. These organisms include prokaryotic and eukaryotic unicellular and multicellular organisms; coniculating bacteria, yeasts, protozoa, algae, and all plants and higher CC including bacteria, yeasts, protozoa, algae, and all plants and higher cc animal forms, including warm blooded animals, particularly humans; also organelle sub-cellular translation and transcription processes. The new CC synthetic process provides pro-oligonucleotides, i.e., oligonucleotides blocked at phosphate groups by bioreversible groups which can be cleaved by intracellular and intercellular enzymes to generate an active oligonucleotide, as for produrings and drugs. By careful selection of phosphate linkages can be achieved in the reaction sequence. Suggested constitution of contents and include Septial provides include Alglocolyl mercaptoethyl (SPME) and didlycolyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                뮍
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAZ57446/c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 1785
                                     represents a phosphorothioate oligonucleotide used of the present invention
                                                 cyanoethylcarbonyl (CEOC) groups. Spacer molecules include diglycolyl (COCH 20CH 20C) and its analogue with a cattechol biresidue replacing the oxygen atom (1,2-phenylenedixy-diacetic acid). The present sequence represents a phosphorothicate oligonucleotide used in the exemplification
     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                  Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oligonucleotide bioreversible phosphate esters used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          11-JUN-1998;

                                                                                                                                                                                 Peroxisome proliferators are agents that induce peroxisomal proliferation. Peroxisome proliferator-activated receptors (PPARs) are members of the steroid receptor superfamily, and are ligand-activated transcription factors. There are three mammalian subtypes of PPAR, alpha, beta (also known as delta) and gamma. The present invention relates to inhibiting angiogenesis by contacting PPAR gamma with a PPAR gamma contactorised by excessive neovascularisation e.g. rheumatoid arthritis, peoriasis, atherosclerosis, diabetes, retinopathy, retrolental fibroplasia, neovascular glaucoma, age-related macular degeneration, themangiomas, thyroid hyperplasias, Grave's disease, tissue transplantation, chronic inflammation, lung inflammation, endometriosis and obesity. The present sequence is a PCR primer for human PPARbeta gene. The resulting PCR product was used in the analysis of PPARbeta

                                                                                                                                                                                                                                                                                                           This sequence is a PCR primer for DNA encoding mouse beta, protein which CC is homologous to the human MTSLEIBeta protein. The invention relates to a CC method for diagnosing a polymorphism associated with a predisposition to CC cancer by detecting a germ-line alteration of a wild-type Multiple Tumour CC suppressor (MTS) gene or its expression products in a human sample. The method comprises detecting a germ-line alteration of a wild-type MTS gene CC predisposition to at least one of the cancers. The cancer is selected CC predisposition to at least one of the cancers. The cancer is selected CC from melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, forman, astrocytoma, glioblastoma, lymphoma, chronic lymphocytic leukaemia (CLL), and cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and CC rectum. The method may be used as the basis for developing very important CC diagnostic tests capable of predicting the predisposition to cancer. The CC provide means for a general anti-cancer therapy by virtue of its ability

                                                                                                                                                                                                                                                                                                             This sequence represents a PCR primer for the human multiple tumour suppressor IEIbeta (MTSIEIbeta) coding sequence. The invention relates the human MTS2 DNA and protein sequences. The DNA sequences are useful for diagnosing or determining a predisposition to cancers e.g. melanomal leukaemia, lymphoma, glioma, Hodgkin's lymphoma and cancers of the
                                                                                                                                                                                                                                                                                                                                                                                                         Multiple tumor suppressor cDNA, useful predisposition to cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TRANSPIRE TUMOUR SUPPRESSOR; MTS2; human; diagnosis; Hodgkin's lymphoma; cancer predisposition; melanoma; leukaemia; lymphoma; glioma; MTS1Elbeta; PCR primer; ss.

                                                                        Query Match
                                                                                                                     The invention relates to ebl-1 polypeptides that are encoded by the DBL (Duffy-binding like) gene family. The ebl-1 proteins are substantially identical to the Duffy Antigen Binding Protein (DABP) and Sialic Acid Binding Protein (SABP), which are soluble proteins that appear in the culture supernatant after crythrocytes infected with malaria release merozoites. Immunochemical studies indicate that DABP and SABP are the respective ligands for Plasmodium vivax and Plasmodium falciparum Duffy and sialic acid receptors on crythrocytes. The ebl-1 polypeptides may be used to vaccinate against malaria, especially caused by P. falciparum. Immunization with the polypeptide provides effective protection against malaria. Sequences AAZ98297-304 represent primers used for isolating sequences encoding the conserved motifs of the DBL family

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents an antisense inhibitor of ICAM-1. The invention CC relates to a pharmaceutical composition comprises an oligonucleotide (ON) cadmixed with a topical delivery agent. The compositions can be used for CC and antisense peptide nucleic acid, an aptamer or a molecular decoy. The CONS can be used to modulate expression of a cellular adhesion protein or CC modulate a rate of cellular proliferation. The compositions can also be used to treat psoriasis. They can also be used to treat the compositions and company fibrosis, layre disease and viral, fungal and CC (xaposi's sarcoma, pulmonary fibrosis, layre disease and viral, fungal and CC (xaposi's sarcoma, pulmonary fibrosis, layre disease and viral, fungal and CC (xaposi's can almals including chickens and turkeys, domestic household, CC (sport or farm animals including rate, mate, rabbits and guinea pigs, CC (sish, reptiles and zoo animals. The compositions and methods may also be used to examine the function of various proteins and genes in vitro in CC cultured or preserved dermal tissues and in animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          growth of the recipient cells. (I) is also useful for increasing the level of expression of MTS gene even in tumour cells in which the mutant gene is expressed at a normal level but the gene product is not fully functional. A host cell transformed with (I) is useful as a model system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a vector (I) comprising an isolated DNA sequence of a multiple tumour suppressor (MTS) gene having a polynucleotide sequence of the human MTSIB1-beta. (I) is useful for introducing wild-type MTS function to a cancerous or pre-cancerous cell which carries diminished or mutant MTS alleles for suppressing neplastic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     to study cancer remission and drug treatment which promotes such remission. The present invention relates to somatic mutations and germ line mutations in the MTS gene and their use in the diagnosis and prognosis of human cancer e.g. melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum. The present sequence represents a PCR primer used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New vector useful for otumor suppressor gene,
                                                                                                                                                                                                                                                                                                      Human; Fas; Apo-1; antisense compound; Fas ligand; Fap-1; hepatitis; Fas associated protein 1; protein tyrosine phosphatase; cancer; autoimmune disease; inflammatory disease; lymphoma; phosphorothioate
                                                                                                                                                                                                                                                                                                                                                                                                                          AAC61834;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (Fast), or Fap-I (Fas associated protein 1, protein tyrosine phosphatase). The antisense compounds are used to inhibit the expression of Fas, Fast or Fap-1 in cells or tissues. They are used to treat autoimmune or inflammatory diseases such as hepatitis. They can also be used to treat cancer, especially colon, liver or lung cancer or lymphoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAC61821-39 represent antisense oligonucleotides which are directed against nucleic acids encoding human Fas ligand. The specification describes antisense compounds which are targeted to the 5'-untranslated

Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to a disease as well as other treatment. The invention includes antisense molecules AhA09644-A09683 which have modified phosphorothioate internucleoside linkages which target various regions of the SHP-1 gene. The oligonucleotides inhibit the expression of human SHP-1 in cells or tissues, and may be used to treat diseases or conditions associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAA09667 standard;

AGP-3 is a tumour necrosis factor (TNF) ligand family member. AGP-3 is a type II transmembrane protein, and is a potent B cell stimulatory factor. Expression of AGP-3 correlates to increases in the number of B cells and immunoglobulins produced. AGP-3 proteins, antibodies, and nucleic acids may be used to treat inflammatory and immune disorders, e.g. rheumatoid arthritis, Crohn's disease, lupus and graft versus host disease. The nucleic acids may be used to regulate the expression of an AGP-3 related protein. The AGP-3 proteins, antibodies and nucleic ands are also useful for the detection of AGP-3 agonists, antagonists and characterizing interactions with AGP-3 related proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            oligonucleotides designed to modulate cellular adhesion. The invention relates to new compositions for the non-parenteral delivery of oligonucleotides comprising at least one oligonucleotide in an emulsion. Oligonucleotides delivered via the compositions of the invention can be used to modulate expression of a cellular adhesion protein, modulate a rate of cellular proliferation, or have biological activity against eukaryotic pathogens or retroviruses. They can be used for treating conditions including e.g., ulcerative colitis, Crohn's disease, inflammatory bowel disease or undue cellular proliferation. The

detecting disease-related point mutations involves extending a primer that binds adjacent to the specific site to incorporate a labeled deoxynucleotide.
                                                                     quantification of the proportion of mutated cells in a mixed population, down to 0.5% of this population. The method is easily automated. This sequence represents a PCR primer used to detect a mutation in the human
                                                                                                                                                                                            plants or microorganisms. By selecting a primer that binds adjacent the specific site, variations at this site can be detected following
                                                                                                                                                                                                                                                                                                                       nucleic acid. The method is specifically used to detect point mutations which are associated with altered pathogenicity or resistance to therapy
                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel method for determining the identity specific nucleotide at one or more defined sites in a target nucleic polymer involves formation of a detectable primer extension product in the specific nucleotide is present at the defined site in the target
                                                                                                                                                  simple manipulations,
                                                                                                                                                                                                                                                                            in a microorganism, particularly human immune deficiency virus or with cancer or a genetic disease (or susceptibility to it) in humans, but mo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 7; Col 17-18; 14pp; English
                                                                                                                                                                                                                                                 generally can be used to detect mutations in RNA or DNA from
                                                                                                                                            ncorporation of only a single dNTP. The method requires only a few, simple manipulations, making is suitable for routine use, and allows

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 1801
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     뮰
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC first strand cDNA species using a first heeled primer, to provide a cc first strand cDNA species; and (b) synthesizing second cDNA species using second heeled primer population, the nucleotide sequences of the non-portions of the second heeled primers being such that the reverse cc transcribed first strand cDNA species are capable of hybridizing to at cleast one second primer. The processes can be used for expression cc profiling of single cells. The polynucleotide comprising an oligo d(T) csequence and a heel sequence 5' can be used for the reverse transcription cc fmRNA species in a sample. The polynucleotide primer population of cc laim (4) can be used for the synthesis of second strand cDNA from a cc population of first strand cDNA species. Single cell cDNA libraries can be made for subsequent detailed analysis of gene expression and the cc discovery of novel genes. Small samples can be used and allow the cc industriant of the large amount of sequence data available for further called Three prime End Amplification (TPEA), optionally with PCR (TPEA, PCR). Prior art methods for the analysis of gene expression within single ccells or small tissue samples are limiting. Whilst in situ hybridization constitutes the detailed information about the cellular expression within single cranscred in the detailed information about the cellular expression constituted in the detailed information about the cellular expression within single cranscred in the detailed information about the cellular expression within the disclosure manufally and the cellular expression within the disclosure manufally and the cellular expression within the disclosure the technique is laborious and unable to analyze multiple transcripts in a single preparation. The methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

The amplification technique can be carried out in a single tube with a need for only limited manual intervention and large numbers of samples can be analyzed. There is a bias towards more uniform length cDNA molecules ensuring that even relatively low abundance mRNA species are transcribed and optionally amplified at the same level of efficiency as more abundant mRNA species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

The variants have the following changes relative to this sequence: A at any of positions 265, 442, 330 and 329; T at any of positions 172, 238, 341 and 148 and deletions of nucleotides 290-294, 172-179 or 128-129. The variants are somatic mutations of MST1, indicative of predisposition to melanoma and many other cancers, so detecting them is useful for diagnosis, prognosis and monitoring of cancer (including prenatal analysis). The cantisense sequences can be used for modulating the synthesis of a CAM.

CT They can be used for treating an animal suspected of having or being compared to a disease or condition associated with a CAM. Oligonucleotides can condition e.g. inflammatory bowel disease such as Crohn's disease or condition or ulcerative colitis, a condition of the skin, e.g. psoriasis or cytotoxic dermatitis, rheumatorid arthritis, allografi rejection, cancer, pneumonia, multiple sclerosis or a viral infection. The ICAM-1 sequences can also be used for reducing corticosteroid use in a patient or for reducing cytosporine use in a patient. The oligonucleotides can also be used for detection and diagnosis. They can also be used for treating e.g. hyperproliferative disorders, tumours, diappedesis, graft versus host disease, arthritis, infections, autoimmune disorders, e.g. autoimmune cultum sequences can compared the conditions of juvenile diabetes mellitus, myasthenia gravis, pemphigus con longeris, systemic lumpus extrhematoris cardiovascular disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antisense oligonucleotides are targeted to a nucleic acid encoding a cellular adhesion molecule (CAM) and is capable of modulating the expression of the CAM. They particularly inhibit intercellular adhesion molecule-1 (ICAM-1), vascular cell adhesion molecule-1 (VCAM-1), or endothelial leukocyte adhesion molecule-1 (ELAM-1). The antisense oligonucleotides can be used to modulate CAM activity in mediating cell:cell interactions and subsequent cellular and biological responses,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               vulgaris, systemic lupus erythematosus, cardiovascular disorders, myocardial ischaemia/reperfusion injury, dilated cardiomyopathy, myocarditis, ischaemic heart disease or stroke

```

The present invention provides a novel method for typing genes, particularly human leukocyte antigen (HIA) coding sequences. The method uses DNA sequences and a taxonomy-based sequence analysis method to assign alleles for HIA-DQA1, HIA-DQB1 and HIA-DRB. These alleles have been linked to diseases such as diabetes, IgA deficiency, multiple sclerosis, cancer, clinical and immunological manifestations of HIV infection, coeliac disease, idiopathic nephrotic syndrome, immune responses to parasite antigens, pemphigus vulgaris, inflammatory bowel disease, rheumatoid arthritis, allergy and other inflammatory diseases Sequence 20 BP; 3 A; 6 C; 6 G; 5 T; 0 U; 0 Other; method

                                                                                                The present invention relates to an aggregated composition comprising a polypeptide having the transport function of herpesviral transport protein VP22. The aggregates can be useful for delivery of oligonucleotides and proteins into cells. The present sequence is one such oligonucleotide which may be delivered into cells using the method of the present invention. The aggregated composition is useful for preparing molecules to cells in vitro. The aggregates and for delivering molecules to cells in vitro. The aggregates are delivered to target cells such as tumour cells in vivo and are useful for treating
